

PHP strpbrk() Function

[< PHP String Reference](#)

Example

Search a string for the characters "oe", and return the rest of the string from where it found the first occurrence of the specified characters:

```
<?php
echo strpbrk("Hello world!", "oe");
?>
```

[Run example »](#)

Definition and Usage

The strpbrk() function searches a string for any of the specified characters.

Note: This function is case-sensitive.

This function returns the rest of the string from where it found the first occurrence of a specified character, otherwise it returns FALSE.

Syntax

```
strpbrk(string, charList)
```

Parameter	Description
<i>string</i>	Required. Specifies the string to search

charlist

Required. Specifies the characters to find

Technical Details

Return Value:

Returns the string starting from the character found, otherwise it returns FALSE

PHP Version: 5+

More Examples

Example 1

This function is case-sensitive ("W" and "w" will not output the same):

```
<?php
echo strpbrk("Hello world!", "W");
echo "<br>";
echo strpbrk("Hello world!", "w");
?>
```
